

Managed Security Services

Structured Technologies provides protection of your data

Comprehensive Security Gateway

Every day, new viruses and spyware infect businesses worldwide. Some have the ability to spread within hours and affect computers and networks of all sizes. Viruses, worms, Trojans and spyware programs cause serious financial damage to companies through data deletion, loss of productivity, network computer downtime, IT administrative overhead and bandwidth consumption. As these attacks become more dynamic and malicious in nature, businesses are forced to look past pc-based protection and stop viruses before they have a chance to inflict damage. We include in our Security Gateway:

- Spyware Protection
- Real-Time Gateway Anti-Virus Scanning
- Powerful Intrusion Prevention
- Integrated Deep Packet Inspection Firewall

Web Content Filtering

Businesses and organizations of all types are now connected to the Internet to meet their organizational goals. In doing so, they are faced with the need to control access to inappropriate or objectionable Web sites. Without that control, businesses risk productivity losses, liability exposure, and misallocation of bandwidth due to non-productive Web surfing. We include in our Web Content Filtering:

- Comprehensive Database
- Category Blocking
- High Recall Performance

Managed Backup Office 10

- Allows up to 10 devices on the network
- Includes two site-to-site VPN connections

Managed Backup Office 20

- Allows up to 20 devices on the network
- Includes five site-to-site VPN connections

Managed Backup Office 40

- Allows up to 40 devices on the network
- Includes five site-to-site VPN connections

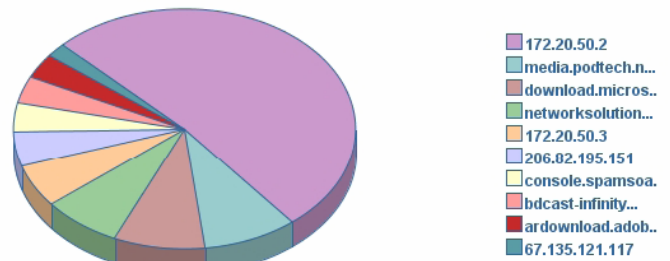

Managed Backup Office 100

- Allows up to 100 devices on the network
- Includes 25 site-to-site VPN connections

Comprehensive Set of Graphical Reports

STI offers a comprehensive set of real-time and historical reports including firewall attacks, bandwidth usage, Web site visits, user activity, and more; allowing organizations to be aware of suspicious activity and to ensure high employee productivity. STI provides summaries of all types of network attacks and informative reports of user behavior, identifying time-wasting or bandwidth intensive activity.

Centralized Management, Monitoring and Reporting

Today, organizations face increasing security challenges in their distributed networks, from security and virus attacks to enforcing security policies. As a distributed network grows and branches into multiple networks linked by the Internet, so does the complexity of managing security appliances, security policies, and updates. A single flaw in security implementation at any point in the network can expose the entire infrastructure, allowing malicious access to important data and files with severe consequences. Managing security for distributed networks on a site-by-site basis is time consuming, expensive, and unreliable-putting a big strain on already limited resources. STI unifies the network policy management, monitoring, and reporting into a single console. Included in Centralized Management, Monitoring, and Reporting is:

- Centralized Secure Management
- Managed VPN Services
- Centralized Reporting
- Active-Network Monitoring
